Much of Napa County is considered a high hazard fire environment. Based on past experience, this area possesses all the ingredients necessary to support large, intense, and uncontrollable wildfires.

Within this hazardous environment, there are individual houses, subdivisions, and entire communities. Many homes, however, would be unable to survive an intense wildfire. Since it is not a question of “if” wildfires will occur but “when” they will occur, the likelihood of human life and property loss is great and growing.

Our ability to live more safely in this fire environment greatly depends upon our use of “pre-fire activities.” Pre-fire activities are actions taken before a wildfire occurs which improve the survivability of people and homes. They include proper vegetation management around the home (known as defensible space), use of fire resistant building materials, appropriate subdivision design, and other measures. Research clearly demonstrates that pre-fire activities save lives and property.

The Napa Communities Firewise Foundation (NCFF) is a 501(c)(3) nonprofit corporation dedicated to supporting community-based education and awareness of the dangers wildfire poses to Napa County residents. The Foundation sponsors a countywide free chipping program to aid residents in complying with state and county defensible space regulations, and provides free consulting to neighborhoods interested in developing a Community Wildfire Protection Plan (CWPP). It also offers workshops on defensible space planning and construction, wildfire behavior, and tips on how to “fire harden” your home to survive an advancing wildland fire.

If you are interested in making a tax-deductible contribution to help support the programs mentioned above, or if you would like to become involved as a NCFF volunteer, e-mail info@napafirewise.org and an NCFF Board member will contact you. Additional information can be found online at www.napafirewise.org
FREQUENTLY ASKED QUESTIONS ABOUT DEFENSIBLE SPACE

More and more homes are being built in high fire hazard environments, resulting in higher fire danger and loss.

In the 1980’s, the term “defensible space” was coined to describe vegetation management practices aimed at reducing the wildfire threat to homes. This article responds to some of the commonly asked questions about defensible space.

WHAT IS DEFENSIBLE SPACE?
Defensible space is the area between a house and an oncoming wildfire where the vegetation has been modified to reduce the wildfire threat and to provide an opportunity for firefighters to effectively defend the house. Sometimes, a defensible space is simply a homeowner’s properly maintained backyard.

WHAT IS THE RELATIONSHIP BETWEEN VEGETATION AND WILDFIRE THREAT?
Many people do not view the plants growing on their property as a threat. But in terms of wildfire, the vegetation adjacent to their homes can have considerable influence upon the survivability of their houses. All vegetation, including plants native to the area as well as ornamental plants, is potential wildfire fuel. If vegetation is properly modified and maintained, a wildfire can be slowed, the length of flames shortened, and the amount of heat reduced, all of which assist firefighters in defending the home against an oncoming wildfire.

HOW DO I CHANGE THE VEGETATION ON MY PROPERTY TO REDUCE THE WILDFIRE THREAT?
The objective of defensible space is to reduce the wildfire threat to a home by changing the characteristics of the adjacent vegetation. Defensible space practices include:
• Increasing the moisture content of vegetation.
• Decreasing the amount of flammable vegetation.
• Shortening plant height.
• Altering the arrangement of plants.
This is accomplished through the “Three R’s of Defensible Space.” The article “Creating An Effective Defensible Space” provides detailed information about changing vegetation characteristics for defensible space.

THE THREE R’S OF DEFENSIBLE SPACE

<table>
<thead>
<tr>
<th>Removal</th>
<th>This technique involves the elimination of entire plants, particularly trees and shrubs, from the site. Examples of removal are cutting down a dead tree or cutting out a flammable shrub.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reduction</td>
<td>The removal of plant parts, such as branches or leaves, constitutes reduction. Examples of reduction are pruning dead wood from a shrub, removing low tree branches, and mowing dried grass.</td>
</tr>
<tr>
<td>Replacement</td>
<td>Replacement is substituting less flammable plants for more hazardous vegetation. Removal of a dense stand of flammable shrubs and planting an irrigated, well-maintained flower bed is an example of replacement.</td>
</tr>
</tbody>
</table>

DOES DEFENSIBLE SPACE MAKE A DIFFERENCE?
Yes. Investigations of homes threatened by wildfire indicate that houses with an effective defensible space are much more likely to survive a wildfire. Furthermore, homes with both an effective defensible space and a nonflammable roof (composition shingles, tile, metal, etc.) are many times more likely to survive a wildfire than those without defensible space and flammable roofs (wood shakes or shingles). Appropriate roofing materials and defensible space give firefighters the opportunity to effectively and safely defend the home.

DOES HAVING A DEFENSIBLE SPACE GUARANTEE MY HOUSE WILL SURVIVE A WILDFIRE?
No. Under extreme conditions, almost any house can burn. But having a defensible space will significantly improve the odds of your home surviving a wildfire.

WHY DOESN’T EVERYONE LIVING IN A HIGH WILDFIRE HAZARD AREA CREATE A DEFENSIBLE SPACE?
The specific reasons for not creating a defensible space are varied. Some individuals believe “it won’t happen to me.” Others think the costs (time, money, effort, loss of privacy, etc.) outweigh the benefits. Some fail to implement defensible space practices simply because of misconceptions or lack of knowledge.
CREATING AN EFFECTIVE DEFENSIBLE SPACE*  
...A Step-by-Step Guide

Are you worried about the wildfire threat to your home, but aren’t sure how to get started in making your home defensible? Follow these six steps to an effective defensible space...

**STEP ONE: HOW BIG IS AN EFFECTIVE DEFENSIBLE SPACE?**

The size of the defensible space area is usually expressed as a distance extending outward from the sides of the house. This distance varies by the type of wildland vegetation growing near the house and the steepness of the terrain.

On the “Recommended Defensible Space Distance” chart presented below, find the vegetation type and percent slope which best describes the area where your house is located. Then find the recommended defensible space distance for your situation.

For example, if your property is surrounded by wildland grasses, and is located on flat land, your recommended defensible space distance would extend 30 feet from the sides of the house. If your house is on a 25% slope and the adjacent wildland vegetation is dense tall brush, your recommended defensible space distance would be 150 feet or more.

If the recommended distance goes beyond your property boundaries, contact the adjacent property owner and work cooperatively on creating a defensible space. The effectiveness of defensible space increases when multiple property owners work together. The local assessor’s office can provide assistance if the owners of adjacent properties are unknown. **Do not work on someone else’s property without their permission.**

Temporarily mark the recommended distance with flagging or strips of cloth tied to shrubs, trees, or stakes around your home. This will be your defensible space area.

---

**DEFENSIBLE SPACE RECOMMENDED DISTANCES—STEEPNESS OF SLOPE**

<table>
<thead>
<tr>
<th>VEGETATION TYPE</th>
<th>FLAT TO GENTLY SLOPING (0 TO 20%)</th>
<th>MODERATELY STEEP (21% TO 40%)</th>
<th>VERY STEEP (+40%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wildland grasses, weeds, and trees</td>
<td><strong>30-50 feet</strong></td>
<td><strong>100 feet</strong></td>
<td><strong>100 feet +</strong></td>
</tr>
<tr>
<td>Includes shrub dominant areas of manzanita,</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>chaparral, or coastal scrub</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Trees</td>
<td>100 feet</td>
<td>150 feet</td>
<td>150 feet +</td>
</tr>
<tr>
<td>Includes forested areas. If substantial grass or shrub understory is present, use those values shown under “shrubs.”</td>
<td>30 feet</td>
<td>100 feet</td>
<td>150 feet +</td>
</tr>
</tbody>
</table>

1) Find the percent slope which best describes your property.  
2) Find the type of vegetation which best describes the wildland plants growing on or near your property.  
3) Locate the number in feet corresponding to your slope and vegetation. This is your recommended defensible space distance.

* Please note the recommendations presented in this article are suggestions made by local firefighters experienced in protecting homes from wildfire. They do not take precedence over local ordinances.  
  CHECK WITH YOUR LOCAL FIRE OR PLANNING DEPARTMENT FOR SPECIFIC REQUIREMENTS.
**STEP TWO:** IS THERE ANY DEAD VEGETATION WITHIN THE RECOMMENDED DEFENSIBLE SPACE AREA?

Dead vegetation includes dead trees and shrubs, dead branches lying on the ground or still attached to living plants, dried grass, flowers and weeds, dropped leaves and needles, and firewood stacks.

In most instances, dead vegetation should be removed from the recommended defensible space area. A description of the types of dead vegetation, you’re likely to encounter and the recommended actions are presented below.

**STEP THREE:** IS THERE A CONTINUOUS DENSE COVER OF SHRUBS OR TREES PRESENT WITHIN THE RECOMMENDED DEFENSIBLE SPACE AREA?

Sometimes wildland plants can occur as an uninterrupted layer of vegetation as opposed to being patchy or widely spaced individual plants. The more continuous and dense the vegetation, the greater the wildfire threat. If this situation is present within your defensible space area, you should “break-it-up” by providing a separation between plants or small groups of plants.

Not only are steep slopes often considered high wildfire areas, they are also highly erosible. When removing shrubs and trees from steep slopes, keep soil disturbance to a minimum. Also, it may be necessary to replace flammable vegetation with other plant materials to prevent excessive soil erosion.

### TYPES OF DEAD VEGETATION AND RECOMMENDED PRACTICE

<table>
<thead>
<tr>
<th>DEAD FUEL TYPE</th>
<th>RECOMMENDED PRACTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>STANDING DEAD TREE</td>
<td>Remove all standing dead trees from within the defensible space area.</td>
</tr>
<tr>
<td>DOWNED DEAD TREE</td>
<td>Remove all down dead trees within the defensible space area if they have recently fallen and are not yet embedded into the ground. Downed trees that are embedded into soil and which cannot be removed without soil disturbance should be left in place. Remove all exposed branches from an embedded downed dead tree.</td>
</tr>
<tr>
<td>DEAD SHRUBS</td>
<td>Remove all dead shrubs from within the defensible space area.</td>
</tr>
<tr>
<td>DRIED GRASSES AND WILDFLOWERS</td>
<td>Once grasses and wildflowers have dried out or “cured,” mow to 3 inches within the defensible space area.</td>
</tr>
<tr>
<td>DEAD NEEDLES, LEAVES, BRANCHES, CONES (ON THE GROUND)</td>
<td>Reduce thick layers of pine needles to a depth of two inches. Do not remove all needles. Take care not to disturb the “duff” layer (dark area at the ground surface where needles are decomposing) if present. Remove dead leaves, twigs, cones, and branches.</td>
</tr>
<tr>
<td>DEAD NEEDLES, LEAVES, BRANCHES, AND TWIGS (OTHER THAN ON THE GROUND)</td>
<td>Remove all dead leaves, branches, twigs, and needles still attached to living trees and shrubs to height of 15 feet above ground. Remove all debris that accumulates on the roof and in rain gutters on a routine basis (at least once annually).</td>
</tr>
<tr>
<td>FIREWOOD AND OTHER COMBUSTIBLE DEBRIS</td>
<td>Locate firewood and other combustible debris (wood scraps, grass clippings, leaf piles, etc.) at least 30 feet uphill from the house.</td>
</tr>
</tbody>
</table>

### Recommended Separation Distances for Shrubs

For areas with dense brush, the recommended separation distance is dependent upon shrub height and steepness of slope. Sample recommendations are presented below.

**Flat to Gently Sloping (0-20%)**

**Moderately Steep (21-40%)**

**Very Steep (+40%)**

Note: Separation distances are measured between canopies (outermost branches) and not between trunks.

For example, if your home is located on a 10% slope and the brush is four feet tall, the separation distance would be two times the shrub height or eight feet. The recommended separation distance can be accomplished by removing plants or through pruning that reduces the diameter or height of shrubs (shorter height means less separation is needed).
If your house is situated on a 30% slope, the separation of tree canopies within your defensible space should be 20 feet. Creating separation between tree canopies can be accomplished through tree removal.

**STEP FOUR: ARE THERE LADDER FUELS PRESENT WITHIN THE RECOMMENDED DEFENSIBLE SPACE AREA?**

Vegetation is often present at varying heights, similar to the rungs of a ladder. Under these conditions, flames from fuels burning at ground level, such as a thick layer of pine needles, can be carried to shrubs which can ignite still higher fuels like tree branches. Vegetation that allows a fire to move from lower growing plants to taller ones is referred to as “ladder fuel.” The ladder fuel problem can be corrected by providing a separation between the vegetation layers.

Within the defensible space area, a vertical separation of three times the height of the lower fuel layer is recommended. For example, if a shrub growing adjacent to a large pine tree is three feet tall, the recommended separation distance would be nine feet. This could be accomplished by removing the lower tree branches, reducing the height of the shrub, or both. The shrub could also be removed.

---

**Recommended Separation Distances Between Tree Canopies**

For forested areas, the recommended amount of separation between tree canopies is determined by steepness of slope. The specific recommendations are presented here. Note: Separations are measured between canopies (outermost branches), not between trunks.

- **Flat to Gently Sloping (0-20%)**
  - 10 feet

- **Moderately Steep (21-40%)**
  - 20 feet

- **Very Steep (+41%)**
  - 30 feet

Recommended Separation of Ladder Fuels
STEP FIVE: IS THERE AN AREA AT LEAST 30 FEET WIDE SURROUNDING YOUR HOUSE THAT IS “LEAN, CLEAN, AND GREEN”?

The area immediately adjacent to your house is particularly important in terms of an effective defensible space. It is also the area that is usually landscaped. Within an area extending at least 30 feet from the house, the vegetation should be kept:

- **LEAN**—small amounts of flammable vegetation,
- **CLEAN**—no accumulation of dead vegetation or other flammable debris, and
- **GREEN**—plants are healthy and green during the fire season.

The “Lean, Clean, and Green Zone Checklist” will help you evaluate the area immediately adjacent to your house.

STEP SIX: IS THE VEGETATION WITHIN THE RECOMMENDED DEFENSIBLE SPACE AREA MAINTAINED ON A REGULAR BASIS?

Keeping your defensible space effective is a continual process. At least annually, review these defensible space steps and take action accordingly. An effective defensible space can be quickly diminished through neglect.

---

**THE LEAN, CLEAN, AND GREEN CHECKLIST**

1. Emphasize the use of low growing herbaceous (non-woody) plants that are kept green during the fire season through irrigation if necessary. Herbaceous plants include lawn, clover, a variety of groundcovers, bedding plants, bulbs, perennial flowers, and conservation grasses.

2. Emphasize use of mulches, rock, and non-combustible hard surfaces (concrete sidewalks, brick patios, and asphalt driveways).

3. Deciduous ornamental trees and shrubs are acceptable if they are kept green and free of dead plant material, ladder fuels are removed, and individual plants or groups of plants are arranged so that adjacent wildland vegetation cannot convey a fire through them to the structure. Shorter deciduous shrubs are preferred.

4. Minimize the use of ornamental coniferous shrubs and trees such as juniper, Monterey pine and tall exotic grasses such as pampas grass.

5. Where permitted, most wildland shrubs and trees should be removed from this zone and replaced with more desirable alternatives (see first box). Individual specimens or small groups of wildland shrubs and trees can be retained so long as they are kept healthy and free of dead wood, are pruned to reduce the amount of fuel and height, and ladder fuels are removed.

6. For some areas substantial removal of wildland vegetation may not be allowed. In these instances, wildland vegetation should conform to the recommendations presented in steps 2 through 4. Please become familiar with local requirements before removal of wildland vegetation.

7. Tree limbs within 10 feet of a chimney, encroaching on powerlines, or touching the house should be removed.

---

**Steps Four, Five, and Six**

- **Step Four:** Remove Ladder Fuels
- **Step Five:** Lean, Clean, and Green
  - Remove branches within 10 feet of chimney.
- **Step Six:** Maintain Defensible Space
**ZONE 1:**
**STRUCTURE IGNITION ZONE (0-10 feet from the structure)**

This zone needs to be lean, clean, and green, since home ignition starts easily. Non-irrigated vegetation should be removed or reduced and cut low so that the potential fire will not ignite the structure.

1. Keep your rain gutters and roof clean of all flammable material.

2. Get rid of dry grass, brush and other flammable materials around your home—and don’t forget leaves, pine needles and bark walkways. Replace with well-maintained (watered) landscape vegetation, green lawn and landscape rocks.

3. Clear all flammable materials from your deck. This includes brooms, stacked wood and easily ignitable patio furniture. Also enclose or board up the area under your deck to keep it from becoming a fuel bed for hot embers.

4. Move woodpiles and garbage cans away from the home 30 feet or more.

5. Use fine mesh metal screen (1/4”) or less to cover eaves, roof and foundation vents to prevent embers from entering.

6. Inspect and clean your chimney every year. Trim away branches within 10 feet. Install a spark arrestor with 1/2-inch mesh screen.

7. Got a propane tank? Get rid of any flammable materials within 10 feet of it and, if possible, position it at least 30 feet from any structures.

8. Window screens should be metal, not plastic or other flammable material.

---

**ZONE 2:**
**FIREBREAK ZONE (10-30 feet from the structure)**

Both horizontal and vertical continuity of fuels must be broken up so a fire cannot reach the house. Trees should be pruned to a height of 10’ from the ground, and flammable brush species should be removed. Remaining vegetation crowns should be kept perhaps 20’ apart, off the ground, and free of dead material.

---

**Burning embers landing on wood shake roofs are one of the leading factors for losing your home to a wildfire.** Replace your wood shake roof with non-flammable (Class-A) roofing materials such as asphalt shingles, tile, or metal.
Create a Firebreak Zone by keeping in mind the Three R’s of defensible space:

<table>
<thead>
<tr>
<th>Zone</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removal</td>
<td>The elimination of entire plants, particularly trees and shrubs, from the site. Examples of removal are cutting down a dead tree or cutting out a flammable shrub.</td>
</tr>
<tr>
<td>Reduction</td>
<td>The removal of plant parts, such as branches or leaves, constitutes reduction. Examples of reduction are pruning dead wood from a shrub, removing low tree branches, and mowing dried grass.</td>
</tr>
<tr>
<td>Replacement</td>
<td>Replacement is substituting less flammable plants for more hazardous vegetation. Removal of a dense stand of flammable shrubs and planting an irrigated, well-maintained flower bed is an example of replacement.</td>
</tr>
</tbody>
</table>

**ZONE 3: REduced FUEL ZONE**  
(30-100 feet from the structure)

This wide area, which expands further on hill slopes, should be modified in an attempt to bring an advancing wildfire to manageable flame lengths.

Experts recommend a minimum of 10 feet of spacing (on level ground) between individual trees and 2X the height for shrubs measured at their widest part. You will need to increase spacing even more on slopes.

Remember to plan for trees and shrubs at their full mature size when planning minimum crown-to-crown separation.

It’s possible, depending upon the size of your property, that you will be limited by your property boundary and unable to complete the fire safe measures identified in zones 2 and 3. If this happens, talk with your neighbors and ask their cooperation. A safer home means a safer neighborhood for everyone.
“When a wildfire comes through your neighborhood, could your home survive on its own?”

A dramatic question, but one we need to consider when living in an environment where wildfire is a threat. Firescaping is landscape design that reduces house and property vulnerability to wildfire. The goal is to develop a landscape with a design and choice of plants that offers the best protection and enhances the property. The ideal is to surround the house with things that are less likely to burn.

It is imperative when building homes in wildfire-prone areas that fire safety be a major factor in landscape design. Appropriate manipulation of the landscape can make a significant contribution toward wildfire survival.

**VEGETATIVE FUEL HAZARDS**

Vegetative fuels include living and dead native vegetation materials. The amount of heat energy released during a wildland fire is defined by the amount, arrangement and rate of combustion of the vegetative fuels. Vegetative fuel flame lengths can exceed 100 feet and the radiated heat can ignite combustible materials from distances of 100 feet or more. Winds can carry live fire brands for several miles.

Firescape integrates traditional landscape functions with a design that reduces the threat from wildfire. It does not need to look much different from a traditional design. In addition to meeting a homeowner’s aesthetic desires and functional needs such as entertaining, playing, storage and erosion control, firescape also includes vegetation modification techniques, planting for fire safety, defensible space principles, and use of fire safety zones.

Mitigation of wildfire hazards focuses on breaking up the continuity of horizontal and vertical fuels. Additional distance between landscape plants is required on slopes.

**REMEMBER TO PROVIDE SEPARATION & SPACING**

Through proper plant selection, placement and maintenance, we can diminish the possibility of ignition, lower fire intensity, and reduce how quickly a fire spreads, increasing a home’s survivability.

In firescaping, plant selection is primarily determined by the plant’s ability to reduce the wildfire threat. Other considerations may be important such as appearance, ability to hold the soil in place, and wildlife habitat value. The traditional foundation planting of junipers is not a viable solution in firescape design. Minimize use of evergreen shrubs within 30 feet of a structure, because junipers, other conifers and broadleaf evergreens contain oils, resins and waxes that make these plants burn with great intensity.

Firefighters call junipers the gasoline plant!

Use ornamental grasses and berries sparingly because they also can be highly flammable. Choose “fire smart” plants. They tend to be low growing, have a high moisture content, and have stems and leaves that are NOT resinous, oily or waxy. Deciduous trees are generally more fire resistant than evergreens because they have a higher moisture content when in leaf, but a lower fuel volume when dormant.

Placement and maintenance of trees and shrubs is as important as actual plant selection. When planning tree placement in the landscape, remember their size at maturity.

Firewise design uses driveways, lawns, walkways, patios, parking areas, areas with inorganic mulches, and fences constructed of nonflammable materials such as rock, brick or cement to reduce fuel loads and create fuel breaks. Fuel breaks are vital components in every firescape design. Water features, pools, ponds or streams can also be fuel breaks. Areas where wildland vegetation has been thinned or replaced with less flammable plants are the traditional fuel break. Remember, while bare ground is an effective fuel break, it is not recommended as a firescape element due to aesthetic, soil erosion and other concerns.

A home located on a brushy site above a south- or west-facing slope will require more extensive wildfire safety landscape planning than a house situated on a flat lot with little vegetation around it.

Boulders and rocks become fire retardant elements in a design. Whether a site can be irrigated will greatly influence location of hardscape (concrete, asphalt, wood decks, etc.), plant selection and placement.

Prevailing winds, seasonal weather, local fire history, and characteristics of native vegetation surrounding the site are additional important considerations.

The 30 feet closest to a structure will be the highest water use area in the fire safe landscape. This is an area where highly flammable fuels are kept to a minimum and plants are kept green throughout the fire season.
Use well-irrigated perennials here. Another choice is low growing or non-woody deciduous plants. Lawn is soothing visually, and is also practical as a wild-fire safety feature. But extensive areas of turf grass may not be right for everyone. Some good alternatives include clover, groundcovers and conservation grasses that are kept green during the fire season through irrigation. Rock mulches are good choices. Patios, masonry or rock planters are excellent fuel breaks and increase wildfire safety. Be creative with boulders, riprap, dry streambeds and sculptural inorganic elements.

**INVASIVE PLANTS AND WEEDS**

An invasive weed is any species that is, or is liable to become, detrimental or destructive to native ecosystems, and for purposes of this publication, represent an increased FIRE HAZARD! They are aggressive, competitive, and difficult to control or eradicate. They compete with native plants and often force them out. Invasive plants threaten the ecological integrity of our precious wildlands. Many invasive weeds and trees are extremely fire prone and can increase the fire threat to your home and property if not removed.

You may be familiar with some of the more common invasive plants such as French and Scotch broom; yellow, Italian and purple distaff; star thistle; barbed goat grass; cape ivy; medusa head; pampas grass; and acacia to name a few.

Surprisingly, our native Douglas fir is becoming a problem as it is vigorously reproducing and is rapidly becoming one of the most fire-prone conifers in Napa County.

Invasive plants and weeds are opportunistic and often establish themselves in disturbed soils along newly graded drives, roads and construction sites.

---

**Fire-Wise Plant Material for Napa County**

Although there are no fireproof plant materials, the following is a list of plants which have a higher fire-resistance than many now in the landscape. These species are recommended for landscaping in high-risk fire areas. Landscape maintenance is far more important to fire prevention than selection of plant materials, but you can get a leg up by avoiding pyrophytic plants – which are not on this list. When planning your landscape, consider the characteristics of the site such as slope, aspect, shade, and precipitation rate and amount that your site receives in making final plant selections. When in doubt, ask your local nursery for recommendations.

A firesafe landscape lets plants and garden elements reveal their innate beauty by leaving space between plants and groups of plants. In firescaping, the open spaces are more important than the plants.

**INVASIVE PLANTS AND WEEDS**

An invasive weed is any species that is, or is liable to become, detrimental or destructive to native ecosystems, and for purposes of this publication, represent an increased FIRE HAZARD! They are aggressive, competitive, and difficult to control or eradicate. They compete with native plants and often force them out. Invasive plants threaten the ecological integrity of our precious wildlands. Many invasive weeds and trees are extremely fire prone and can increase the fire threat to your home and property if not removed.

You may be familiar with some of the more common invasive plants such as French and Scotch broom; yellow, Italian and purple distaff; star thistle; barbed goat grass; cape ivy; medusa head; pampas grass; and acacia to name a few.

Surprisingly, our native Douglas fir is becoming a problem as it is vigorously reproducing and is rapidly becoming one of the most fire-prone conifers in Napa County.

Invasive plants and weeds are opportunistic and often establish themselves in disturbed soils along newly graded drives, roads and construction sites.
Firewise Construction Checklist
Wildfire and your structure ignition Zone – Is your home ignition prone?
How a house is designed, where it is built, materials used in its construction, landscaping, and access all influence survivability during a wildfire. Presented below are recommendations and illustrations that will make a home much easier to defend and will improve its chances of surviving a wildfire with or without direct firefighting intervention.

Choose a firewise location if you are constructing a new home.

Survivable Space is similar to Defensible Space, except it emphasizes the house surviving without significant firefighter or homeowner action. It combines Defensible Space with ignition resistant construction methods and materials, many of which can be retrofitted to existing homes.

Ignition Resistant Construction
+ Defensible Space
= Survivable Space!

Slope of Terrain: Be sure to build on the most level portion of the land, since fire spreads more rapidly on even minor slopes. Avoid building on mid-slopes and away from ridge tops, canyons and areas between high points on a ridge.

Locating a Home on your lot or acreage: Set your single-story structure at least 30 feet back from any ridge or slope; increase distance if your home will be higher than one story. Try not to build on mid-slope sites.

Consider or add ignition-resistant construction elements for your new or existing home.

Design, build or maintain a firewise structure utilizing passive ignition resistant measures. Use or replace construction materials that are ignition-resistant whenever possible. Use construction methods that resist ignition and fire infiltration.

Set back from the Property Line

Build your home at least 30 feet from the property line so adequate defensible space can be established. If building on acreage, consider a minimum setback of 100 feet or more.

Avoid

Better

Fire-resistant roof, siding and double-pane windows

Roof: For new and replacement roof construction, use only materials such as Class-A asphalt shingles, slate, clay tile, metal or concrete products. Constructing a fire-resistant sub-roof can add additional protection. Avoid use of valleys and gutters where flammable debris can collect.

Siding / Exterior Wall Facing: Use fire-resistive exterior wall systems and materials that are at least “one hour rated” — materials that will hold back fire for a minimum of one hour. Stucco or masonry, or ignition-resistant siding panels or boards are good choices. They are much better than wood, wood shingles, aluminum or vinyl, all of which are readily ignitible and/or fail quickly. Underlayment of gypsum board combined with ignition-resistant siding adds even greater protection.

Doors: Provide at least two ground level doors for easy and safe exit and at least two means of escape (i.e., doors or windows) in each room so that everyone has two ways out. Exterior doors should be “one hour rated” doors that will hold back fire for a minimum of one hour.

Be sure to provide metal thresholds and install doors to be flush so burning embers cannot blow under them.

Garage Doors can also be vulnerable to failure by fire. Choose a steel clad model.

Window Materials and size are important. Smaller panes hold up better in their frames than larger ones. Double or triple pane especially with tempered glass and Low-E reflectivity are even more effective heat barriers than single pane glass. Avoid use of plastic window framing and use metal, not plastic screening.

Soffits, Eaves, Decks, Balconies and Overhangs

Soffit SOFF it. n. “The exposed underside of any overhead structural component of a building, such as eaves, balconies, decks, beams, arches, cornices and lintels.”

Open Eaves, Decks and Overhangs can all act as heat traps and make the building more vulnerable to flying embers and brands and intense heat from nearby fire.

Eaves Enclosed - box in soffits and under eave areas with “one-hour” rated material.

Decks can act as heat traps and can be ignited by wind-driven flying embers and fire brands. Use skirting to enclose or box underside of deck with “one hour” rated covering.

Enclose the underside of balconies and above-ground decks with fire resistant materials.

Composite Lumber: Many different companies manufacture composite lumber, each with its own proprietary formula and structural design. It is primarily used in outdoor decks and railings. It may be in the form of solid boards or may contain hollow areas. Composite lumber is a mix of plastic, wood binder and other ingredients that may provide ignition resistance inferior to wood products. When burning, composite materials tend to drip flaming liquefied plastic that “pools” on the surface below and continues to burn intensely. The State Fire Marshal’s Office has flammability test results available. As with wood decking, it is crucial to protect the underside of any deck and keep cracks and crevices free of any debris.

Interior Residential Fire Sprinklers are important because they have proven to extinguish undetected fire when the structure is occupied or unoccupied.
Interior residential fire sprinklers may extinguish fire originating from an exterior source, i.e., a wildland fire where radiant, convective heat or direct flame contact has caused structural failure that allows fire intrusion into the building. They may also prevent a house fire from spreading to the wildlands.

**Shutters:** Install non-flammable shutters on windows. This is a particularly good measure for weekend homes that are not continuously occupied but is also appropriate for homes that are.

**Vents:** To prevent sparks from entering your home through vents, cover exterior soffit, attic, roof and under floor vents with wire mesh no larger than 1/4 inch mesh or less. Attic vents are not recommended.

**Plastic exterior building components** such as siding, decks, vents, skylights, gutters and downspouts and certain window frames can melt and/or ignite and should not be used. Use metal components where possible.

**Gutters** are best if eliminated completely. Utilize gravel-filled French drain under dripline instead. If gutters are necessary, maintain gutters and roofs (particularly valleys) clear of leaves and other debris. No plastic!

**Attachments** include any structures, such as decks, porches, balconies, fences, gates, breezeways or accessory buildings, connected directly to your home.

**Attachments can act as fuel bridges, or fire fuses!** If an attachment to a home is not ignition resistant, then the home may be at risk.

If you choose to attach a fence to your home, use masonry or metal, or distance as a protective barrier between it and the house. A wrought iron style gate separating a combustible fence may provide some protection.

Build an ignition-resistant fence and gate. Use metal when constructing a trellis and cover it with high-moisture, low flammability vegetation.

**Exterior Vertical Structural Members such as Combustible Posts or Columns:** Vertical members that support decks, balconies and overhangs that are not protected by ground to deck skirting should be clad with galvanized or copper sheathing to at least 1-3 feet above ground OR built on concrete footings at least 1-foot above grade.

**ACCESS**

Identify at least two exit routes from your neighborhood. Design roads and drives for large emergency vehicles.

Construct roads or provide turnouts that allow two-way traffic.

Design bridges to carry heavy emergency vehicles, including bulldozers carried on large trucks.

Post clear road signs to show traffic restrictions such as dead-end roads and weight and height limitations.

Make sure dead-end roads and long driveways have turnaround areas wide enough for emergency vehicles. Clear turnouts along one-way roads.

Construct driveways to allow large emergency equipment to reach your house.

Clear dry grass and flammable brush up to ten feet from roads and five feet from driveways. Retention of mature trees along roadside is OK.

Make sure that your street is named or numbered and a sign is visibly posted at each street intersection.

Make sure that your street name and number is not duplicated elsewhere in the county.

Post your home address in CONTRASTING BOLD 4-inch letters at the beginning of your driveway or on your house if it is easily visible.

**EMERGENCY WATER SUPPLY**

Maintain an emergency water supply that meets fire department standards through one of the following:

- A community water/hydrant system
- A cooperative emergency water storage tank with neighbors
- A minimum dedicated (for fire) storage supply of 2,500 gallons on your property. More may be required or prudent.
- Clearly mark all emergency water sources and notify your local fire department of their existence.
- Create easy firefighter access to your closest emergency water source.

**INSPECTION & MAINTENANCE**

Make periodic inspections of your home, looking for deterioration such as breaks and spaces between roof tiles, warping wood, cracks and crevices, or rodent entry points in the structure. Prevent combustible materials and debris including dry grass from accumulating beneath patio decks or elevated porches. Screen or enclose areas below decks with wire mesh screen no larger than 1/4 inch mesh OR less. Even better, construct skirting from the deck to the ground of ignition-resistant materials.

All the defensible space in the world is useless if you don’t conduct regular maintenance!

Stack woodpiles at least 30 feet from all structures and clear flammable vegetation within 10 feet of woodpiles.

One cord of firewood contains 20 million BTUs of heat energy, or the equivalent of 160 gallons of gasoline. Do you want that near your home?

Locate propane tanks at least 30 feet from any structure and surround them with 10 feet of clearance. Be sure that your tank has seismic tie downs.

Remove all stacks of construction materials, pine needles, leaves and other debris from your yard.

Remove dead branches hanging over your roof.

Remove any branches within 10 feet of your chimney.

Clean all dead leaves and needles from your roof and gutters.

Install a roof that meets Class “A” rating requirements.

Cover your chimney outlet and stovepipe with a non-flammable screen of one-half inch mesh.

This Checklist is not intended to replace official building code requirements, but hopes to offer suggestions when considering firesafe ignition-resistant construction methods. Remember that your home may be part of the problem.

In designing or upgrading your firewise ignition-resistant home, remember that the goal is to complement it with adequate defensible space.

CAUSES OF HOME IGNITION FROM WILDFIRES

During a wildland fire, three conditions stand out as ignition threats to homes and outbuildings.

WIND-DRIVEN EMBERS and firebrands blown ahead of the fire that land in areas that catch or trap them. Heat traps include roof valleys and gutters, open eaves, soffits, overhangs, or under decks and balconies.

RADIANT HEAT generally from flammable vegetation or adjacent burning homes that are too close to your home.

DIRECT FLAME CONTACT from flammable native or urban landscaping, attached wood fences and accumulation or storage of flammable materials against the house or under decks.

Note that 50% of the houses with wood roofs and less than 30 feet of vegetation clearance were destroyed by wildfire. But less than 1% of the homes with fire resistant roofs and 100 feet of clearance were destroyed.

THE LIMITATIONS OF WILDLAND FIREFIGHTING

A lot of people assume that when a wildfire starts, it will be quickly controlled and extinguished. This is accurate 97% of the time. The vast majority of these fires are small fires in small fuels. Firefighters have the ability, equipment, and technology to effectively suppress most wildfires. But 3% of the time wildfires burn so intensely that there is little firefighters can do.

Presented at right are firefighter tactics as they relate to common wildland fuels.

<table>
<thead>
<tr>
<th>FUEL TYPE</th>
<th>EFFECTIVE SUPPRESSION TACTICS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grassland</td>
<td>Where accessible, suppression by fire engines using hose lines is the method of choice. Fireline constructed with hand tools can also be effective.</td>
</tr>
<tr>
<td>Coastal Scrub Brush</td>
<td>Fire engines with water and hose lines will be needed to knock down the fire. Air tankers, helicopters and bulldozers may be required.</td>
</tr>
<tr>
<td>(less than 4’ tall)</td>
<td>Air tankers with fire-suppressing retardant &amp; helicopters are required to reduce the fire’s rate of spread before engines, fire crews or bulldozers can be effective. Burning out vegetation between the fireline and the advancing fire may be necessary.</td>
</tr>
<tr>
<td>Heavy Chaparral</td>
<td>Direct fire suppression ineffective! Fire will need to be fought using roads, streams and natural barriers. Burning out may be necessary.</td>
</tr>
<tr>
<td>(a mix of brush types 4’-1.5’ tall containing a large amount of dead material)</td>
<td></td>
</tr>
<tr>
<td>Dense Conifer Forest</td>

IF WILDFIRE APPROACHES

If your home or neighborhood is threatened by wildfire, occupants may be advised to evacuate. Your Family Emergency Plan should be in place and practiced regularly by all family members before an emergency occurs! Include the following recommendations at a minimum. When in doubt - EVACUATE!

Pre-Fire & Emergency Preparations:
- Develop a family emergency plan
- Meet with your family and discuss the types of disasters that could occur
- Have a broad-based plan that will work for most disasters including wildfire
- Discuss where to go and what to bring if advised to evacuate
- Determine and discuss two evacuation routes
- Show responsible family members how, where and when to shut off water, gas and electricity at main controls.
- Practice what you have discussed
- Plan how your family will stay in contact if separated by disaster
- Pick two meeting places: (1) a place a safe distance from home in case of a home fire; (2) a place outside your neighborhood in case you can’t return home.
- Choose an out-of-area friend as a “check-in contact” for everyone to call & make sure they have the phone numbers.
- Relay your plans to the contact person

WHATEN WILDFIRE APPROACHES

What should I have with me?
- Wear only cotton or wool clothes
- Safe attire includes long pants, long sleeved shirt or jacket and boots
- Warm clothing for cold nights
- Carry gloves, goggles, a handkerchief to cover your face and water to drink
- Keep a flashlight and portable radio with you at all times
- Tune in to a local radio station and listen for instructions

What about family members and pets?
- Stay together
- Evacuate all family members and pets
- Capture your pets early as there will be confusion. Restrain them by leash, locked in a bedroom or kennel cage.

How should I prepare my car?
- Place the vehicle in the garage, pointing out with keys in ignition - don’t lock keys in car
- Place essential items in the car
- Roll up all windows when departing from the garage
- Always keep the tank at least half full
- Disconnect the electric garage door opener so that the door can be opened manually
- Close garage door upon leaving

How should I leave my home?
- Close all interior doors
- Leave a light on in each room
- Remove lightweight, non-fire-resistant curtains and other combustible materials around windows
- Close fire-resistant drapes
- Move over stuffed furniture such as couches and easy chairs to the center of the room
- Shut off main gas supply to house
- Know two or more ways out

What should I take?
- Important documents (bank, IRS, trust, investment, insurance policies, birth certificates, passports and medical records)
- Credit and ATM cards
- Medications
- Prescription glasses & spares
- Driver’s license
- Passport
- Computer backup files
- Inventory of home contents (consider video taping)
- Photographs of the exterior of the house and landscape
- Address book
- Cell phone and charger
- Personal toiletries
- Change of clothing for each family member
- Family photo albums and videos
- Family heirlooms

What about the outside of my home?
- Shut off propane at the tank or natural gas at the meter
- Show responsible family members how and when to shut off water, gas and electricity at main controls
- Close all exterior vents if possible
- Prop a ladder against the house to provide firefighters with access to the roof
- Make sure all garden hoses are connected and have spray nozzles attached
- Close all exterior doors and windows
- Leave exterior doors unlocked
- Turn on outside lights
- If available and there is time, cover windows, attic openings and vents with plywood that is at least one-half inch thick

If a fire should occur within the house or the wildland around it, contact the fire department immediately. Continue to inspect your house and property for flame or embers.

Most importantly, STAY CALM!
THANK YOU!

Napa Firewise wishes to acknowledge the generous support that made the printing of this publication possible.

FREE Chipping Helps You Maintain Your Defensible Space

One of the key elements in building a defensible space zone around your home or outbuilding is the reduction of volatile fire fuels on a regular basis. This means seasonal maintenance once a fuel reduction plan is implemented.

Because vegetation management can be a time-consuming and costly process, Napa Firewise offers a FREE chipping service to Napa County residents to help them financially sustain their defensible space over time. All that is required to participate is the completion of an application form. The form can be found on the Napa Communities Firewise Foundation Web site at www.napafirewise.org. Just click on “Chipping Program” and follow the instructions. It’s that easy.

Visit the Napa Communities Firewise Foundation (NCFF) web site at www.napafirewise.org for listings of upcoming workshops and other events relating to wildfire awareness and preparedness. Donations to NCFF are tax deductible.
