April 17, 2020

The Upper Alta Heights Water System Improvement Project began in September 2019 when an inspection indicated the need to repair or replace a corroding tank at the top of the hill. Safety measures were enacted in September to ensure system stability. The City analyzed several long-term options and determined that pump station improvements could not only improve operational efficiency, but also reduce the need for the corroding tank during normal operations. These pump station improvements were completed in February 2020, and a temporary replacement tank was activated in March 2020.

The City is developing plans to replace the older pressure tank, likely in 2020 or 2021.
